PROFILE

I start every product from one human moment and take it all the way to the App Store: the problem, the design, the build, App Review and the launch. Before that I ran an engineering publication of 4,600 authors, where the job was deciding what was ready and what needed another draft. Same skill, different medium.

PRODUCTS SHIPPED

19 apps live on the App Store · 65 approved releases since December 2025 · iOS, two also on Mac · solo, from research to launch

Orbits	Find common ground for a trip or a meetup: everyone swipes, the plan is what you all liked.	12 releases
Breakline	See how your body moves in your own clips, frame by frame, across seven sports. On-device coach; measurements only, never a score; nothing uploaded.	7 releases in 4 months
Rifflet	Turn a music idea into a lesson anyone can play, kids included. iPhone, iPad and Mac.	7 releases
Screen Room	Talk about a film without spoilers: the ending stays hidden until you ask.	Launched 2 Nov
First Contact Duet	Two phones, one friendly visitor you greet with hand signs and chords.	Live

Next: Wearover 3.0 (in App Review): pick a photo and a look, the clothes change, your face stays. Also building Glint, a market desk that shows where every number came from and never places orders.

HOW I MAKE PRODUCT CALLS

- **Trust is the feature.** Breakline measures and never grades; Glint's agents can draft an order but none can place one without my approval of that exact order and amount.
- **Cut to ship.** Releases go out from a written scope and checklist; anything a reviewer can't reach or verify comes out, even when built, like a third-party ordering flow I kept out of the next Breakline.
- **On-device AI that has to show its work.** Apple Intelligence features answer only from measured facts, and Swift checks each reply before anyone sees it; Screen Room's film chat was tested on a fixed set of 20 questions before release.
- **Run the team in writing.** I work with AI coding agents the way I ran editors: written briefs, one writes, a different one reviews, nobody grades their own work.

EXPERIENCE

Independent iOS & macOS developer · Apple platforms — 2024 – present

- Products above. Merged upstream fixes in open-source developer tools (deja-vu, Beads, CodexBar, birdclaw, agent-device).

Managing Editor · Better Programming, Medium — 2021 – 2023

- Took over in 2021 and ran it until September 2023. Read thousands of submissions a month with a small editor team; decided what was ready and coached writers through the rest. Over its life: 4,600 authors, 16,800 stories, 151 million views, close to $1M paid to writers.
- Started Coffee Bytes (2022 – 2023): weekly picks, roundups and author interviews that put other writers in front of readers.

Android Team Lead & iOS Developer · Agricx, Bengaluru — 2018 – 2019

- Led the Android team and planned work with the web and ML teams. Built the company's first iOS app alone: a camera that grades crops on the device.

Mobile Developer · MOBEY, Gold Coast · Aged Care Decisions, Brisbane — 2015 – 2021

- Lead Android developer on MOBEY's customer and driver apps, built from nothing; redesigned its iOS apps (on 7 News Brisbane). White-label apps for Aged Care Decisions. Every team was an ocean away, so I learned to work in writing first.

Android Developer & Technical Writer · JournalDev — 2015 – 2019

- Wrote 300+ tutorials on Android, Java, Kotlin and Swift and built the site's first Android app. The site was later acquired by DigitalOcean.

SKILLS & EDUCATION

Product discovery · Scoping and releases · App Store launch and App Review · On-device AI · Editorial judgement · Swift, Kotlin
B.E. Computer Science · BITS Pilani, Hyderabad · 2011 – 2015
